ICENI: A Next Generation Grid Middleware

Delivering e-Science

Dr Nathalie Furmento

London e-Science Centre,
Imperial College London, UK

The problem: Thermohaline circulation

- Ocean transports heat through the "global conveyor belt."
- Heat transport controls global climate.
- Wish to investigate strength of model ocean circulation as a function of two external parameters.
- Use GENIE-Trainer.

- Wish to perform $31 \times 31 = 961$ individual simulations.
- Each simulation takes $\sim 4$ hours to execute on typical Intel P3/1GHz, 256MB RAM, machine ⇒

\[ \text{time taken for 961 sequential runs} \approx 163 \text{ days} \]
The Solution:
Delivering Grid Computing Resources

- Use flocked Condor pools between SReSC, DoC at Imperial College London, and LeSC (~200 Linux and Solaris nodes).
- time taken for 961 Condor runs \( \approx 3 \) days!!!

    Advantages of Condor:
    - simulations are nearly parallel.
    - automatic checkpointing and job migration.
    - Condor File Transfer Mechanism.

    Problems:
    - Firewalls! Overcame by designating and utilising port ranges specified by the Condor and firewall admin.

The Results:
Scientific Achievements

- Intensity of the thermohaline circulation as a function of freshwater flux between Atlantic and Pacific oceans (DFWX), and mid-Atlantic and North Atlantic (DFWY).
- Surface air temperature difference between extreme states (off - on) of the thermohaline circulation.
- North Atlantic 2°C colder when the circulation is off.

Next Steps

- Specify Experiment

- Analyse Results
- Archive Results
- OGGI
- ICENI

ICENI: Imperial College e-Science Network Infrastructure

- Interoperable and Integrated Grid Middleware
- Service Oriented Architecture (SOA) with rich Metadata Description
- Augmented Component Programming Model
- Service Federation govern by Usage Policy and Service Level Agreement
- Foundation for higher-level Services and Autonomous Composition

Contract (SLA) Specified Services within ICENI

Scheduling job over Resources

ICENI Semantic Service Adaptation Framework

- Semantic Matching Service performs service discovery based on Requirement of the Client and Capability of Available Services
- Adaptation Service adapts requirement interface to service implementations.

```
add3(int a, int b, int c) sum(int[] a)
```

```
1,2,0 int[] {1,2}
```

```
AddService.add(1,2)
```
Prototype Implementation

- Semantically annotate Services with RDF and OWL (ontology)
- Semantically matching Services using the Euler inference engine
- Service Adaptation using graph transformation rules

Demonstration

- The movie of the demonstration is available at:
  http://www.lesc.ic.ac.uk/iceni/demos.html

ICENI Release 1.0 available !!!

- ICENI Open Source licence (extended SISSL)
- Project website & mailing lists
- Daily builds, regression & automated deployment tests
- Documentation, manuals & user guide
