Foundations of Software Engineering

Jean-Rémy Falleri
Foundations of Software Engineering

● **Prerequisite**
  ○ Object oriented programming
  ○ Programmation mobile
  ○ Project management

● **We learn**
  ○ Main concepts and activities involved in software development
  ○ Some good practices

● **We do not learn**
  ○ A magical formula to create perfect software systems
  ○ Advanced tools for requirements, architecture or design

● **Notation**
  ○ Practical / Project

● **Organisation**
  ○ 9 lectures of 2h40 and 1 of 1h20
Introduction
Prelude: once in a lab

Dr Dobbs: The Non-Existential Software Crisis: Debunking the Chaos Report
Bad software can lead to dire consequences
Therac-25

The six documented accidents occurred when the high-current electron beam generated in X-ray mode was delivered directly to patients. Two software faults were to blame.[3] One, when the operator incorrectly selected X-ray mode before quickly changing to electron mode, which allowed the electron beam to be set for X-ray mode without the X-ray target being in place. A second fault allowed the electron beam to activate during field-light mode, during which no beam scanner was active or target was in place.

Previous models had hardware interlocks to prevent such faults, but the Therac-25 had removed them, depending instead on software checks for safety.

The high-current electron beam struck the patients with approximately 100 times the intended dose of radiation, and over a narrower area, delivering a potentially lethal dose of beta radiation. The feeling was described by patient Ray Cox as "an intense electric shock", causing him to scream and run out of the treatment room.[4] Several days later, radiation burns appeared, and the patients showed the symptoms of radiation poisoning; in three cases, the injured patients later died as a result of the overdose.[5]
Ariane 5

Ariane 5's first test flight (Ariane 5 Flight 501) on 4 June 1996 failed, with the rocket self-destructing 37 seconds after launch because of a malfunction in the control software. A data conversion from 64-bit floating point value to 16-bit signed integer value to be stored in a variable representing horizontal bias caused a processor trap (operand error) because the floating point value was too large to be represented by a 16-bit signed integer. The software was originally written for the Ariane 4 where efficiency considerations (the computer running the software had an 80% maximum workload requirement) led to four variables being protected with a handler while three others, including the horizontal bias variable, were left unprotected because it was thought that they were "physically limited or that there was a large margin of safety". The software, written in Ada, was included in the Ariane 5 through the reuse of an entire Ariane 4 subsystem despite the fact that the particular software containing the bug, which was just a part of the subsystem, was not required by the Ariane 5 because it has a different preparation sequence than the Ariane 4.
MCAS on the 737 MAX was designed to mimic the pitching behavior of the previous generation of the series, the Boeing 737 NG, by pushing down the aircraft nose from an elevated angle of attack (AoA) by automatically adjusting the horizontal stabilizer and trim tab. The system was intended to protect pilots from inadvertently flying at too steep an angle, which could result in a stall. Boeing, however, asserted that MCAS was not an anti-stall system, as the media widely reported it to be. Pilot movement of the control column on the MAX did not disable MCAS, unlike an earlier implementation of MCAS on the U.S. Air Force Boeing 767 Tanker. During certification of the MAX, Boeing requested and received permission from the FAA to remove a description of MCAS from the aircraft manual, leaving pilots unaware of the system when the airplane entered service in 2017. Boeing had also knowingly withheld knowledge, for at least a year before the Lion Air crash, that a system to warn of a possible AoA malfunction did not work as advertised.

On November 6, 2018, Boeing published a supplementary service bulletin prompted by the first crash. The bulletin describes warnings triggered by erroneous AoA data could cause the pitch trim system to repeatedly push down the nose of the airplane and referred pilots to a "non-normal runway trim" procedure as resolution, specifying a narrow window of a few seconds before the system would reactivate and pitch the nose down again. The FAA issued an emergency airworthiness directive, 2018-23-51, on November 7, 2018, requiring the bulletin's inclusion in the flight manuals, and that pilots immediately review the new information provided. Pilots wanted to know more about the issue, and Boeing responded by publicly naming MCAS for the first time in another message to airlines, noting that MCAS operates "without pilot input."

In December 2018, the FAA had privately predicted that 15 MCAS-related accidents could result if the system was not redesigned. Boeing said it would revise MCAS software by April 2019 to correct any problems. The study was only revealed a year later at the December 2019 House of Representatives hearing. Stephen Dickson, who became FAA administrator during the accident investigations, testified at the hearing about his agency's response after the Lion Air accident, saying "the result was not satisfactory."
It’s your job to make sure the software system is built right and you don’t want to improvise.

        if (parameqn(line, p->str, n)) {
```
SENDING MESSAGES

Sending an SMS or MMS is one of the most common tasks performed on the Twilio Platform.
Sending a message is as simple as POSTing to the Messages resource. We’ll outline required and optional parameters, messaging services, alphanumeric sender ID, rate limiting, and handling message replies below.

HTTP POST to Messages

To send a new outgoing message, make an HTTP POST to your Messages list resource URL:

```
/2010-04-01/Accounts/{AccountSid}/Messages
```

POST Parameters

Required Parameters

The To parameter is **required** in your POST to send the message:

<table>
<thead>
<tr>
<th>PARAMETER</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>The destination phone number. Format with a <code>+</code> and country code e.g., +16175551212 (E.164 format).</td>
</tr>
</tbody>
</table>
Validation

test "error access is indifferent" do
  errors = ActiveModel::Errors.new(self)
  errors[:foo] << "omg"

  assert_equal ["omg"], errors["foo"]
end

test "values returns an array of messages" do
  errors = ActiveModel::Errors.new(self)
  errors.messages[:foo] = "omg"
  errors.messages[:baz] = "zomg"

  assert_equal ["omg", "zomg"], errors.values
end

test "values returns an empty array after try to get a message only" do
  errors = ActiveModel::Errors.new(self)
  errors.messages[:foo]
  errors.messages[:baz]

  assert_equal [], errors.values
end

test "keys returns the error keys" do
  errors = ActiveModel::Errors.new(self)
  errors.messages[:foo] << "omg"
  errors.messages[:baz] << "zomg"

  assert_equal [:foo, :baz], errors.keys
end
Deployment

The #1 programmer excuse for legitimately slacking off:

"My code's compiling."

Hey! Get back to work!
Compiling!
Oh, carry on.
Processes: big design up-front
Processes: iterative style
Requirements, in a nutshell
Requirements importance in one comic strip
The hardest single part of building a software system is deciding precisely what to build. No other part of the conceptual work is as difficult as establishing the detailed technical requirements, including all the interfaces to people, to machines, and to other software systems. No other part of the work so cripples the resulting system if done wrong. No other part is more difficult to rectify later.
The mythical cost of defect by phases
Recommended book

“Hello, Phil? This is Maria in Human Resources. We’re having a problem with the personnel system you programmed for us. An employee just changed her name to Sparkle Starlight, and we can’t get the system to accept the name change. Can you help?”

“She married some guy named Starlight?”

“No, she didn’t get married, just changed her name,” Maria replied. “That’s the problem. It looks like we can change a name only if someone’s marital status changes.”

“Well, yeah, I never thought someone might just change her name. I don’t remember you telling me about this possibility when we talked about the system,” Phil said.

“I assumed you knew that people could legally change their name anytime they like,” responded Maria. “We have to straighten this out by Friday or Sparkle won’t be able to cash her paycheck. Can you fix the bug by then?”

“It’s not a bug!” Phil retorted. “I never knew you needed this capability. I’m busy on the new performance evaluation system. I can probably fix it by the end of the month, but not by Friday. Sorry about that. Next time, tell me these things earlier and please write them down.”

“What am I supposed to tell Sparkle?” demanded Maria. “She’ll be upset if she can’t cash her check.”

“Hey, Maria, it’s not my fault,” Phil protested. “If you’d told me in the first place that you had to be able to change someone’s name at any time, this wouldn’t have happened. You can’t blame me for not reading your mind.”

Angry and resigned, Maria snapped, “Yeah, well, this is the kind of thing that makes me hate computers. Call me as soon as you get it fixed, will you?”
What is a requirement?

Ian Sommerville and Pete Sawyer (1997)
Requirements are a specification of what should be implemented. They are descriptions of how the system should behave, or of a system property or attribute. They may be a constraint on the development process of the system.
Broad kind of requirements
Gathering requirements

**Figure 1.3** An example of how different stakeholders participate in requirements development.
Working with requirements

● Developing requirements
  ○ Elicitation (discovering requirements)
  ○ Analysis (cleaning and ranking requirements)
  ○ Specification (organizing the requirements)
  ○ Validation (ensuring the requirements are correct)

● Maintaining requirements
  ○ Managing change and tracing of requirements in the system

Removed assertion roulette (test smell) #187

eas5 commented on 28 Jul

The idea is to have only one assertion per test method. To do so, some deprecated assertions were updated, as well as comparison strategies for arrays.

jlfaller and others added 6 commits on 29 Jan 2018

- release v2.1.1
- Merge branch 'develop'
- Missing TypeDeclaration name in gen.jdt #98
- Missing TypeDeclaration name in gen.jdt #98
- Merge pull request #99 from FlorianLehmann/master
- merged version 2.1.2

monperus commented on 55617f1 on 1 Mar 2019

Great! Is 2.1.2 released on Maven Central? (we would then update gumtree-spoon).

- Removed assertion roulette test smell and updated deprecated assertion

Add more commits by pushing to the test_improvements branch on eas5/gumtree.

15     16 import { isArray, MutableArray } from '../mixins/array';
16     17 import { assert } from '@ember/debug';
17     18
19 + const CONSUMED = symbol('ARRAY_PROXY_CONSUMED');
```

chadhietala 13 days ago • edited  ▶  Member

Is there a reason to use this over a WeakMap?

pzuraq 13 days ago  ▶  Author  ▶  Contributor

Not really, we could definitely update it to a WeakMap or WeakSet. I figured there may be perf implications, but don't have a strong opinion one way or the other

rwjblue 13 days ago  ▶  Member

Ya, I generally agree with @chadhietala here. I'd prefer to avoid adding arbitrary fields to the underlying objects. I doubt there is much difference between this implementation and a WeakMap/WeakSet based one, but I'm happy to test if you'd like to assuage concerns...

Code writing
What is software systems’ quality?

Functional quality + Structural quality = System quality
Functional and structural quality

- Qualité fonctionnelle : le logiciel est conforme à ses spécifications fonctionnelles (ce qu’il doit faire)
- Qualité structurelle
  - Le logiciel est conforme à ses spécifications non fonctionnelles (comment il doit faire : est-il assez rapide ? est-il assez sécurisé ?)
  - La structure interne du logiciel est bonne (architecture, code source)
Always code as if the guy who ends up maintaining your code will be a violent psychopath who knows where you live.
The mythical productivity curve
Clean Code
A Handbook of Agile Software Craftsmanship

Foreword by James O. Coplien

Robert C. Martin
I like my code to be elegant and efficient. The logic should be straightforward to make it hard for bugs to hide, the dependencies minimal to ease maintenance, error handling complete according to an articulated strategy, and performance close to optimal so as not to tempt people to make the code messy with unprincipled optimizations. **Clean code does one thing well.**
Grady Booch (expert POO)

**Clean code is simple and direct.** Clean code reads like well-written prose. Clean code never obscures the designer’s intent but rather is full of crisp abstractions and straightforward lines of control.
Dave Thomas (*parrain d’Eclipse*)

**Clean code can be read, and enhanced by a developer other than its original author.** It has unit and acceptance tests. It has meaningful names. It provides one way rather than many ways for doing one thing. It has minimal dependencies, which are explicitly defined, and provides a clear and minimal API. Code should be literate since depending on the language, not all necessary information can be expressed clearly in code alone.
I could list all of the qualities that I notice in clean code, but there is one overarching quality that leads to all of them. **Clean code always looks like it was written by someone who cares.** There is nothing obvious that you can do to make it better. All of those things were thought about by the code’s author, and if you try to imagine improvements, you’re led back to where you are, sitting in appreciation of the code someone left for you, code left by someone who cares deeply about the craft.
What is clean code?

Clean code is

● Easy to understand
● Easy to use
● Easy to reuse
● Easy to evolve

Information carrying names

● The name of a class, method or variable must convey its goal
● If you feel like commenting a name, choose a better name!
● Don’t hesitate to spend time on choosing a good name
● Use business domain names (Account)
● Use general developer knowledge names (LinkedList)
Avoid disinformation

● Avoid *ambiguous* names
  ○ *tmp* temperature or temporary variable?

● Avoid *referring to the implementation*, it can change!
  ○ *accounts* instead of *accountList*

● Avoid *ambiguous* characters
  ○ *L I 1 O 0*
No encoding

- Modern types systems and IDE make encoding obsolete

```java
public class Part {
    private String m_dsc; // The textual description
    void setName(String name) {
        m_dsc = name;
    }
}
```

😢

```java
public class Part {
    private String description
    void setDescription(String description) {
        this.description = description;
    }
}
```

😀
Searchable names

- Developer search for identifiers almost every day! Avoid magic number or one letter identifiers

🤔

```java
for (int j = 0; j < 34; j++) {
    s += (t[j] * 4) / 5;
}
```

😄

```java
int realDaysPerIdealDay = 4;
int WORK_DAYS_PER_WEEK = 5;
int sum = 0;
for (int j = 0; j < NUMBER_OF_TASKS; j++) {
    int realTaskDays = taskEstimate[j] * realDaysPerIdealDay;
    int realTaskWeeks = (realdays / WORK_DAYS_PER_WEEK);
    sum += realTaskWeeks;
}
```
One concept, one word

- Avoid using different names for the same concept or developers will be confused

 поможет

```c
void getTimer();
void retrieveTime();
void fetchDate();
```

очень поможет

```c
void getTimer();
void getTime();
void getDate();
```
No jokes

- Use only straightforward identifiers

😢

```java
void goodbye();
```

😀

```java
void exit();
```
Functions
Good practices

- Rule 1: write short functions
  - A few lines only: 5, 10
- Rule 2: a function does one thing
- Rule 3: few paramètres
  - Zero, one or two
Stepdown rule

- One abstraction level per function
  - High-level functions call low level functions that makes the essence of the computation to be done
- The *stepdown rule*
  - Code is read like a story from top to bottom
  - Top-level functions outline the computation, low-level one implement the details

```java
private void createGui() {
    add(createDataEntryPanel(), BorderLayout.NORTH);
    add(createButtonPanel(), BorderLayout.SOUTH);
    setJMenuBar(createMenuBar());
}
```

```java
private void createGui() {
    createDataEntryPanel();
    createButtonPanel();
    createMenuBar();
}
```

```java
private JPanel createDataEntryPanel() { ... };
private JPanel createButtonPanel() { ... }
private JMenuBar createMenuBar() { ... }
```
Function parameters

- Try to **reduce the number of parameters**
- When more than two parameters
  - Introduce new functions
  - Use the receiver
  - Introduce custom data types

```java
void render(boolean isSuite);
render(true); // when called
```

```java
void renderForSuite();
void renderForSingleTest();
```
Function parameters

```java
public void doSomethingWithEmployee(String name, double pay, Date hireDate);

public void doSomethingWithEmployee(Employee employee);

void appendFooter(Report report); // side-effect on report?

Report r;
r.appendFooter();
```
Side effects

- Avoid function that makes both side effects and return values
- If a function makes side-effects it must be crystal clear in its name

```java
public class UserValidator {
    private Cryptographer cryptographer;

    public boolean checkPassword(String userName, String password) {
        User user = UserGateway.findByName(userName);
        if (user != User.NULL) {
            String codedPhrase = user.getPhraseEncodedByPassword();
            String phrase = cryptographer.decrypt(codedPhrase, password);
            if ("Valid Password".equals(phrase)) {
                Session.initialize();
                return true;
            }
        }
        return false;
    }
}
```
Handle error with exceptions

😊

```java
if (deletePage(page) == E_OK) {
    if (registry.deleteReference(page.name) == E_OK) {
        if (configKeys.deleteKey(page.name.makeKey()) == E_OK) {
            logger.log("page deleted");
        } else {
            logger.log("configKey not deleted");
        }
    } else {
        logger.log("deleteReference from registry failed");
    }
} else {
    logger.log("delete failed"); return E_ERROR;
}

😊

try {
    deletePage(page);
    registry.deleteReference(page.name);
    configKeys.deleteKey(page.name.makeKey());
} catch (Exception e) {
    logger.log(e.getMessage());
}
```
Error handling is one thing

- Avoid mixing classical computation and error handling

```java
public void delete(Page page) {
    try {
        deletePageAndAllReferences(page);
    } catch (Exception e) {
        logError(e);
    }
}

private void deletePageAndAllReferences(Page page) throws Exception {
    deletePage(page);
    registry.deleteReference(page.name);
    configKeys.deleteKey(page.name.makeKey());
}

private void logError(Exception e) {
    logger.log(e.getMessage());
}
```
D’ont Repeat Yourself

- Avoid writing twice the same code
  - You’ll have to fix the bugs everywhere!
  - Maybe a missing abstraction?

```java
void setR(int r) {
    if (r < 0) this.r = 0;
    else if (r > 255) this.r = 255;
    else this.r = r;
}

void setG(int g) {
    if (g < 0) this.g = 0;
    else if (g > 255) this.g = 255;
    else this.g = g;
}

int putIn0To10Range(int number) {
    if (number < 0) return 0;
    else if (number > 255) return 255;
    else return number;
}
```
Comments
Good practices

- Comments can quickly become a **bad practice**
- They have to evolve along with the code
- Therefore, they can become **outright lies**
Comments don’t make up for bad code. If you feel the need for a comment to explain some code, put effort into improving the code, not authoring comments for it.
Naming and comments

- A well chosen name often avoid the necessity of comments

```java
// Check to see if the employee is eligible for full benefits
if ((employee.flags & HOU bLY_FLAG) && (employee.age > 65))
```

😊

```java
if (employee.isEligibleForFullBenefits())
```
Good comments

- Clarify the intent of the code

```java
public int compareTo(Object o) {
    if (o instanceof WikiPagePath) {
        WikiPagePath p = (WikiPagePath) o;
        String compressedName = StringUtil.join(names, "");
        String compressedArgumentName = StringUtil.join(p.names, "");
        return compressedName.compareTo(compressedArgumentName);
    }
    return 1;
    // we are greater because we are the right type.
}
```
Good comments

- Licenses
- TODO

😀

// Copyright (C) 2003,2004,2005 by Object Mentor, Inc. All rights reserved.
// Released under the terms of the GNU General Public License version 2 or later.

😀

// TODO-MdM these are not needed
// We expect this to go away when we do the checkout model
protected VersionInfo makeVersion() throws Exception {
    return null;
}
Bad comments

- Paraphrasing the code

```java
/**
* Default constructor.
*/
protected Date() {}

/**
* Returns the day of the month.
* @return the day of the month.
*/
public int getDayOfMonth() {
    return dayOfMonth;
}
```
Good comments

- Explain the code further
- Generate a high-quality documentation

```java
/**
 * Create a date with the current system's timestamp.
 */
protected Date() {}

/**
 * @return the day of the month of the corresponding date, between 1 and 31.
 */
public int getDayOfMonth() {
    return dayOfMonth;
}
```
Formatting
Code should be written for human beings to understand, and only incidentally for machines to execute.
Vertical spacing

- Vertical spacing between concepts

```java
package fitnesse.wikitext.widgets;
import java.util.regex.*;
public class BoldWidget extends ParentWidget {
    public static final String REGEXP = "'''.+?'''";
    private static final Pattern pattern = Pattern.compile("''(.+?)'''", Pattern.MULTILINE + Pattern.DOTALL);
    public BoldWidget(ParentWidget parent, String text) throws Exception {
        super(parent);
        Matcher match = pattern.matcher(text);
        match.find();
        addChildWidgets(match.group(1));
    }
}
```
package fitnesse.wikitext.widgets;

import java.util.regex.*;

public class BoldWidget extends ParentWidget {
  public static final String REGEXP = "'''.+?'''";
  private static final Pattern pattern = Pattern.compile("'''.+?'''", Pattern.MULTILINE + Pattern.DOTALL);

  public BoldWidget(ParentWidget parent, String text) throws Exception {
    super(parent);
    Matcher match = pattern.matcher(text);
    match.find();
    addChildWidgets(match.group(1));
  }
}
Density and vertical spacing

- Density and order express a link between elements
- Attributes are declared on top of the class
- Related attributes must be close
- Callee methods must be close to caller methods
- Variable are declared closed to their usage location
Horizontal spacing

● Horizontal spacing makes it easier to read the code
  ○ Space around operators
  ○ Space around method parameters
  ○ Always indent scopes

```java
public void add(int x, int y) {
    int z = x + y;
    return z;
}
```

😀

```java
public void add(int x, int y) {
    int z = x + y;
    return z;
}
```

😀
Formatting as a team rule

- Each team must think about and enforce formatting rules to produce consistent code
- Language traditions, if any, supersede team rules (think about newcomers)
- Your code must look like anybody’s code
Services and data
Services objects

- Hide implementation details and provide services

```java
public interface Point {
    double getX();
    double getY();
    void setCartesian(double x, double y);
    double getR();
    double getTheta();
    void setPolar(double r, double theta);
}
```
Data objects

- Structure the data and do not provide any service

```java
public class Point {
    public double x;
    public double y;
}
```
Complementarity data and services

- Easy to add new service objects by extending the base class
- Hard to add new services because all current subclasses must be modified

- Data objects makes it easy to add new services because you can always add a function
- Hard to add new attributes into data objects since you have to modify all existing functions
Demeter’s law

- Only talk to your friends
- A method \( f \) of class \( C \) only talks to
  - \( C \)
  - Objects created by \( f \)
  - Objects passed to \( f \)
  - Attributes of \( C \)

```java
final String outputDir = ctxt.getOptions().getScratchDir().getAbsolutePath();
```
Classes
Classes should be small

```java
public class SuperDashboard extends JFrame implements MetaDataUser {
    public String getCustomizerLanguagePath()
    public void setSystemConfigPath(String systemConfigPath)
    public String getSystemConfigDocument()
    public boolean getGuruState()
    public boolean getNoviceState()
    public boolean getOpenSourceState()
    public void showObject(MetaObject object)
    public void showProgress(String s)
    public boolean isMetadataDirty()
    public void setIsMetadataDirty(boolean isMetadataDirty)
    public Component getLastFocusedComponent()
    public void setLastFocused(Component lastFocused)
    public boolean isMouseSelected()
    public LanguageManager getLanguageManager()
    public Project getProject()
    public Project getFirstProject()
    public Project getLastProject()
    public String getNewProjectName()
    public void setComponentSizes(Dimension dim)
    public String getCurrentDir()
    public void setCurrentDir(String newDir)
}
```
Small classes does not always make sense

public class SuperDashboard extends JFrame implements MetaDataUser
    public Component getLastFocusedComponent()
    public void setLastFocused(Component lastFocused)
    public int getMajorVersionNumber()
    public int getMinorVersionNumber()
    public int getBuildNumber()
**Single Responsibility Principle**

- Classes should have only one reason to change

```java
public class SuperDashboard extends JFrame implements MetaDataUser {
    public Component getLastFocusedComponent()
    public void setLastFocused(Component lastFocused)
    public int getMajorVersionNumber()
    public int getMinorVersionNumber()
    public int getBuildNumber()
}
```

```java
public class Version {
    public int getMajorVersionNumber()
    public int getMinorVersionNumber()
    public int getBuildNumber()
}
```
Cohesion

- Methods of a class should use its attributes

```java
public class Stack {
    private int topOfStack = 0;
    List<Integer> elements = new LinkedList<Integer>();

    public int size() {
        return topOfStack;
    }
    public void push(int element) {
        topOfStack++;
        elements.add(element);
    }
    public int pop() throws PoppedWhenEmpty {
        if (topOfStack == 0)
            throw new PoppedWhenEmpty();
        int element = elements.get(--topOfStack);
        elements.remove(topOfStack);
        return element;
    }
}
```
Cohesion and SRP

- Using both == a lot of tiny classes
- A complex system **IS** complex
- Do you three very large drawers
- Or a bunch of tiny drawers?
Tests
Why do we test software

- Testing make you way more confident about the fact that your system behaves in the right manner
  - It implements the requirements
  - It has the required performance
  - ...
- Tests aims at detecting and correcting errors
Test principle

- We perform a sequence of actions on the system
- We compare the **observed state** of the system to the **expected state**
- If both states are equivalent the test is **passing**
- If not the test is **failing**
Black box and white box testing

- White box testing assumes that you know the internal structure of the code to test
  - Example: `int z = y / x;`
  - We should test what happens for `x = 0`
  - If you test code you wrote, you are in a white box situation

- Black box testing knows nothing about the internal structure, it relies only on the requirements
  - Example: *the system must return the value of y divided by x*
  - Requires an independent testing team
Tests classification

- **Unit tests**: ensure a software component works well when isolated from the other components
- **Integration tests**: ensures that several dependent components works well together
- **Acceptance test**: ensures that the system works as intended
- **System test**: ensures properties about the behavior of the system (performance, …)
La pyramide des tests

Acceptance tests

Integration tests

Unit tests
Unit tests
Unit tests

**FIRST properties of unit tests**

**FAST**  
Many hundreds or thousands per second

**Isolates**  
Failure reasons become obvious

**Repeatable**  
Run repeatedly in any order, any time

**Self-validating**  
No manual evaluation required

**Timely**  
Written before the code
Unit tests principles

- **Arrange**
- **Act**
- **Assert**

```java
import org.junit.Test;
import static org.junit.Assert.*;

class MyTest {
    @Test
    public void testConcatenate() {
        Concatenator c = new Concatenator(); // arrange
        String result = c.concatenate("one", "two"); // act
        assertEquals("onetwo", result); // assert
    }
}
```
Arrange

- Unit tests has to prepare its required data
- Test data has to be independent from the other tests
- Test data has to be independent from the system
Assert

- Check the **observed** (actual) vs **expected** state
- One logical assert per test

```java
assertEquals(Object expected, Object actual)
same(Object expected, Object actual)
sameNotSame(Object expected, Object actual)
sameNull(Object object)
sameNotNull(Object object)
sameTrue(boolean condition)
sameFalse(boolean condition)
fail(String)
```
Unit tests isolation

- Fréquemment un module nécessite un autre module pour fonctionner
  - Module DisplayTemperature nécessite le module RetrieveTemperature
- Ceci dit un test non passant du module DisplayTemperature doit uniquement provenir d’une erreur interne à ce module
- Que faire en cas d’erreur dans le module RetrieveTemperature?
Doublures de test
Qu’est-ce qu’une doublure de test?

- Le principe : **utiliser un module spécialement créé pour le test**
- Les doublures de test servent principalement à assurer l’isolation des tests
  - Au lieu d’utiliser le vrai module `RetrieveTemperature` on utilise un module `RetrieveTemperature` créé spécialement pour le test
- Les doublures de test on beaucoup d’autres bénéfices, elles permettent de tester des modules en présence dépendances
  - non disponible (la classe du développeur lent)
  - non-déterministe (du code qui appelle `Math.random()`)
  - lentes (un algorithme très complexe)
  - difficile à mettre en place (BDD)
  - comportant des situations exceptionnelles (déconnexion réseau)
@Test
public void testDisplayTemperature() {
    DisplayTemperature d = new DisplayTemperature(new ZeroDegreeRetrieveTemperature());
    assertEquals("0 degrees", d.getTemperatureMessage());
}

public class ZeroDegreeRetrieveTemperature extends RetrieveTemperature {
    public double getTemperature() {
        return 0D;
    }
}
Les différents types de doublures

- Les fantômes (*dummy*) : valeurs qui se substituent à un objet qui ne sert à rien (exemple: `null` ou `new Object()`)
- Les bouchons (*stubs*) : écrits à la main par le développeur pour un test donné
- Les substituts (*fake*) : écrits à la main par le développeur pour plusieurs tests
- Les simulacres (*mock*) : générés par un framework
- Les espions (*spy*) : simulacres qui retiennent les actions que l’on fait sur eux
Les simulacres

- Sont moins coûteux à mettre en oeuvre que les bouchons
- Les utiliser en priorité

😊

```java
@Test
class TestDisplayTemperature {
    public void testDisplayTemperature() {
        // mocking
        RetrieveTemperature zeroDegree = mock(RetrieveTemperature.class);
        when(zeroDegree.getTemperature()).thenReturn(0);
        // test
        DisplayTemperature d = new DisplayTemperature(zeroDegree);
        assertEquals(d.getTemperatureMessage(), "0 degrees");
    }
}
```
Tests’ quality
Tests’ quality

- Comment peut on s’assurer que les tests sont suffisants?
La couverture de test
La couverture de test

😊 Permet de savoir quelles instructions ont été réellement exécutées
😊 Permet de donner une mesure quantitative rapide sur l’effort de test
😢 100% de couverture ne veut pas dire tout est testé
😢 Ne permet pas de savoir si les tests pourront détecter des erreurs si il y en a
L’analyse des tests par mutation

**Calculator.java**

```java
package de.triology.blog.pitest;

class Calculator {
    static int add(int a, int b) {
        return a + b;
    }

    static int subtract(int a, int b) {
        return a - b;
    }

    static int multiply(int a, int b) {
        return a * b;
    }
}

**Mutations**

1. Replaced integer addition with subtraction → KILLED
2. replaced return of integer sized value with (x == 0 ? 1 : 0) → KILLED
1. Replaced integer subtraction with addition → SURVIVED
2. replaced return of integer sized value with (x == 0 ? 1 : 0) → KILLED
1. Replaced integer multiplication with division → SURVIVED
```
L’analyse des tests par mutation

ёт Permet de vérifier que vos tests permettent **vraiment** de détecter des programmes défaillants

ёт Permet de pointer des cas précis où les tests ne capturent pas une erreur

ёт Permet de dériver une métrique quantitative sur la qualité des tests (ratio de mutant tués)
   ○ mais imprécise car un mutant peut-être équivalent au programme original

ёт Ne permet pas de savoir quelles sont les parties testées ou non testée d’un logiciel
Outillage
nano? REAL PROGRAMMERS USE emacs

HEY. REAL PROGRAMMERS USE vim.

WELL, REAL PROGRAMMERS USE ed.

NO, REAL PROGRAMMERS USE cat.

REAL PROGRAMMERS USE A MAGNETIZED NEEDLE AND A STEADY HAND.

EXCUSE ME, BUT REAL PROGRAMMERS USE BUTTERFLIES.

THEY OPEN THEIR HANDS AND LET THE DELICATE WINGS FLAP ONCE.

THE DISTURBANCE RIPPLES OUTWARD, CHANGING THE FLOW OF THE EDDY CURRENTS IN THE UPPER ATMOSPHERE.

WHICH ACT AS LENSES THAT DEFLECT INCOMING COSMIC RAYS, FOCUSING THEM TO STRIKE THE DRIVE PLATTER AND FLIP THE DESIRED BIT.

NICE.
‘COURSE, THERE’S AN EMACS COMMAND TO DO THAT.
OH YEAH! GOOD OL’ C-x M-c M-butterfly...

DAMMIT, EMACS.
La *tool stack*

- Les pratiques seules ne suffisent pas
- Si elles sont uniquement théoriques elles peuvent être oubliées
- Il faut des outils pour systématiser leur application
- Les différents outils utilisés dans un développement logiciel s’appellent la *tool stack*
- La tool stack est vitale pour assurer la qualité logicielle
Les VCS

- Permettent de gérer l’historique de développement du code
Les linters

- Les linters permettent de vérifier la plupart des principes du clean code (taille des méthodes, formatage, …)
Les runners de test

- Permettent de lancer les tests et de récupérer leurs résultats

```java
java.lang.AssertionError:
Expected: asString(is "30")
got: <30L>

at com.developpez.rpouiller.testjunit4.TestContratObject.toStringNOK(TestContratObject.java:17)
```
Les outils de couverture
Les *build tools*

- Permettent de coordonner tous les outils (compilation, linter, test, déploiement, …)
Les différentes façons d’utiliser les outils

● Dans l’IDE
  ○ Permet un feedback instantané aux développeurs mais peut “polluer“

● En ligne de commande
  ○ Fournit des résultats à la demande mais il faut penser à le lancer

● Dans les deux cas, la charge est au développeur de penser à utiliser correctement les outils
L’intégration continue
Avantages de l’intégration continue

- Toute la tool stack est appliquée à chaque commit
- Dans un environnement contrôlé
- Quelque soit le développeur

```script
script: ./gradlew check
after_success:
  - ./gradlew coveralls uploadArchives
language: java
jdk:
  - oraclejdk8
deploy:
  provider: releases
  skip_cleanup: true
  on:
    branch: master
    tags: true
  file: dist/build/distributions/gumtree.zip
```
