Understanding code changes

```
1 import java.util.Random;↓
2 ↓
3 public class Example {↓
4 ↓
5     public void hello() {↓
6         System.out.println(x: "Hello everybody!");↓
7         System.out.println(x: "This code is a magnificent example");↓
8         System.out.println(x: "For the ASE 2014 conference");↓
9         System.out.println(x: "It draws a number at random");↓
10        System.out.println(x: "Adds 10");↓
11        System.out.println(x: "Multiplies by 10");↓
12        System.out.println(x: "And displays it");↓
13        Random r = new Random();↓
14        int i = r.nextInt();↓
15        i += 10;↓
16        i *= 10;↓
17        System.out.println(i);↓
18    }↓
19 ↓
20 }
```

Original version

```
1 import java.util.Random;↓
2 ↓
3 public class Example {↓
4 ↓
5     public void hello() {↓
6         System.out.println(x: "Hello everybody!");↓
7         System.out.println(x: "This code is a magnificent example");↓
8         System.out.println(x: "For the ASE 2014 conference");↓
9         System.out.println(x: "It draws a number at random");↓
10        System.out.println(x: "Adds 10");↓
11        System.out.println(x: "Multiplies the result by 10");↓
12        System.out.println(x: "And displays it");↓
13        int i = random();↓
14        System.out.println(i);↓
15    }↓
16 ↓
17     public int random() {↓
18         Random r = new Random();↓
19         int i = r.nextInt();↓
20         i += 10;↓
21         i *= 10;↓
22         return i;↓
23    }↓
24 ↓
25 }↓
26
```

Modified version

Textual evolution inference

① Code model

```
1.  Foo
2.  Bar
3.  Baz
```

list of text lines

② Action model

```
1.  Foo
2.  Bar
3.  Baz
```

delete line

```
1.  Foo
2.  Bar
3.  Baz
```

add line

③ Min. action sequence from the *original* to *modified* code

```
1.  Foo
2.  Bar
3.  Baz
4.  Bat
```

original

```
1.  Hello
2.  Foo
3.  Bar
```

modified

```
1.  Foo
2.  Bar
3.  Baz
4.  Bat
```

```
1.  Hello
2.  Foo
3.  Bar
```

Textual evolution inference

```
1 import java.util.Random;
2
3 public class Example {
4
5     public void hello() {
6         System.out.println("Hello everybody!");
7         System.out.println("This code is a magnificent example");
8         System.out.println("For the ASE 2014 conference");
9         System.out.println("It draws a number at random");
10        System.out.println("Adds 10");
11        System.out.println("Multiplies by 10");
12        System.out.println("And displays it");
13
14        Random r = new Random();
15        int i = r.nextInt();
16        i += 10;
17        i *= 10;
18        System.out.println(i);
19    }
20 }
```

Diff, 1974

```
1 import java.util.Random;

Syntactic boundaries issues

Syntactic evolution inference

```
1 import java.util.Random;
2
3 public class Example {
4
5     public void hello() {
6         System.out.println("Hello everybody!");
7         System.out.println("This code is a magnificent example");
8         System.out.println("For the ASE 2014 conference");
9         System.out.println("It draws a number at random");
10        System.out.println("Adds 10");
11        System.out.println("Multiplies by 10");
12        System.out.println("And displays it");
13        Random r = new Random();
14        int i = r.nextInt();
15        i += 10;
16        i *= 10;
17        System.out.println(i);
18    }
19
20 }
```

```
1 import java.util.Random;
2
3 public class Example {
4
5     public void hello() {
6         System.out.println("Hello everybody!");
7         System.out.println("This code is a magnificent example");
8         System.out.println("For the ASE 2014 conference");
9         System.out.println("It draws a number at random");
10        System.out.println("Adds 10");
11        System.out.println("Multiplies the result by 10");
12        System.out.println("And displays it");
13        int i = random();
14        System.out.println(i);
15    }
16
17    public int random() {
18        Random r = new Random();
19        int i = r.nextInt();
20        i += 10;
21        i *= 10;
22        return i;
23    }
24
25 }
26
```

GumTree, 2014

**Language-agnostic syntactic differencing approach
(around 15 languages supported)**

GumTree in a nutshell: top-down phase

```
public class Foo {
    public void foo() {
        print("unchanged");
        print("original");
    }
}
```

min_size threshold

```
public class Foo {
    public void foo() {
        print("unchanged");
        print("modified");
    }
}
```

GumTree in a nutshell: bottom-up phase

```
public class Foo {  
    public void foo() {  
        print("unchanged");  
        print("original");  
    }  
}
```

```
public class Foo {  
    public void foo() {  
        print("unchanged");  
        print("modified");  
    }  
}
```

GumTree in a nutshell: recovery phase

```
public class Foo {  
    public void foo() {  
        print("unchanged");  
        print("original");  
    }  
}
```

$O(n^3)$ → max_size threshold

```
public class Foo {  
    public void foo() {  
        print("unchanged");  
        print("modified");  
    }  
}
```

GumTree in a nutshell: with recovery

```
public class Foo {
    public void foo() {
        print("unchanged");
        print("original");
    }
}
```

```
public class Foo {
    public void foo() {
        print("unchanged");
        print("modified");
    }
}
```

GumTree in a nutshell: without recovery

```
public class Foo {
    public void foo() {
        print("unchanged");
        print("original");
    }
}
```

```
public class Foo {
    public void foo() {
        print("unchanged");
        print("modified");
    }
}
```
